

Barrier nets and screens RDA model

QUALITY and SAFETY

This barrier is our top model and for many Customers it's the best universal one on the market. We also think so!

It is attached to the headrests with a **patented** mechanism so strong to successfully pass the crash test defined by the strict **DIN Norm 75-410. No drilling is needed!**

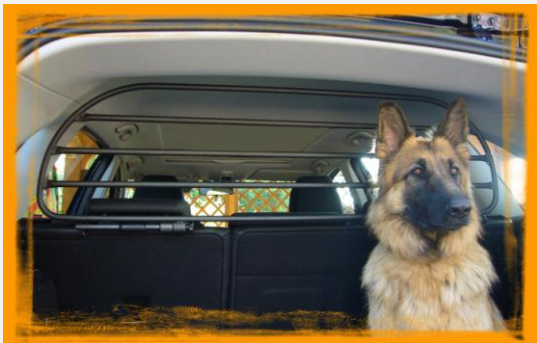

(The standard production clamp is dark grey, the clamp in the picture is yellow only to highlight the picture.)

The mechanism is made of two hexagonal brackets, one attached to the headrests vertical bars, one to the barrier, that are held together by a nylon clamp. Due to the hexagonal brackets it has a very high resistance at twist.

The two hexagonal channels of the clamps are not aligned: since they differ by a 30 degrees angle, it is possible to achieve the best position of the barrier in relation to the headrests and the trunk cover.

The trunk cover can be kept in use almost always.

Two couples of toothed gears allow a further possibility to achieve the best position of the barrier in relation to the car body.

Once the brackets are attached to the headrests bars in the best position possible (this process takes few minutes), the barrier can be installed and removed in a very short time.

!!! View the movie !!!

Seven sizes are available, both as barrier nets and as all metal screens.

Our barriers can fit almost all cars on the market ([see applications list](#)).

In the "[OTHER PRODUCTS](#)" many interesting proposals for your dog!
